1 Introduction & Architecture

MyWay is a web application inspired by *Komoot*, designed for interactive map exploration, route planning, and GPX track management. The project is organized as a client-server comprising **Angular 21** (frontend) and **Spring Boot 4.1.1** on **Java 25** (backend).

2 Backend

- **Java 25, Spring Boot:** a robust framework to expose REST APIs, handling HTTP routing, request validation, and error management out of the box.
- **Postgres Database:** the standard open-source relational database, chosen for its seamless compatibility with Spring Data JPA and straightforward setup via Docker.

3 Frontend

- **Typescript 5, Angular:** provides a "batteries-included" setup with built-in routing, form validation, and HTTP client, while TypeScript prevents runtime errors by strictly typing data received from the backend.

4 Other

- **Docker:** packages the database and frontend into containers, ensuring that the application runs identically on every team member's computer without environment mismatches.
- **Flyway:** keeps the database structure synchronized across the entire team and CI pipeline, eliminating manual SQL execution when entities change.
